

AMENDMENTS TO THE SPECIFICATION

IN THE ABSTRACT:

Please replace the abstract with the following new paragraph:

In a liquid crystal television device that is a wireless communication device, speaker storage sections are integrally formed with a main body section containing parts such as a liquid crystal panel section. Although the main body section is electromagnetically shielded, the speaker storage sections are not electromagnetically shielded. Antennas are provided along with speakers in speaker storage sections so as to have directions of installation different from each other by 90 degrees. This realizes a wireless communication device including an antenna structure capable of improving transmitting/receiving sensitivity in all directions.
